# Modeling of human Exposure to Lyme disease Risk in a French forest Landscape

Vincent Godard  
and

Kristell Méha, Chérif Benabderrahmane

Maison des Sciences de l'Homme  
Paris Nord

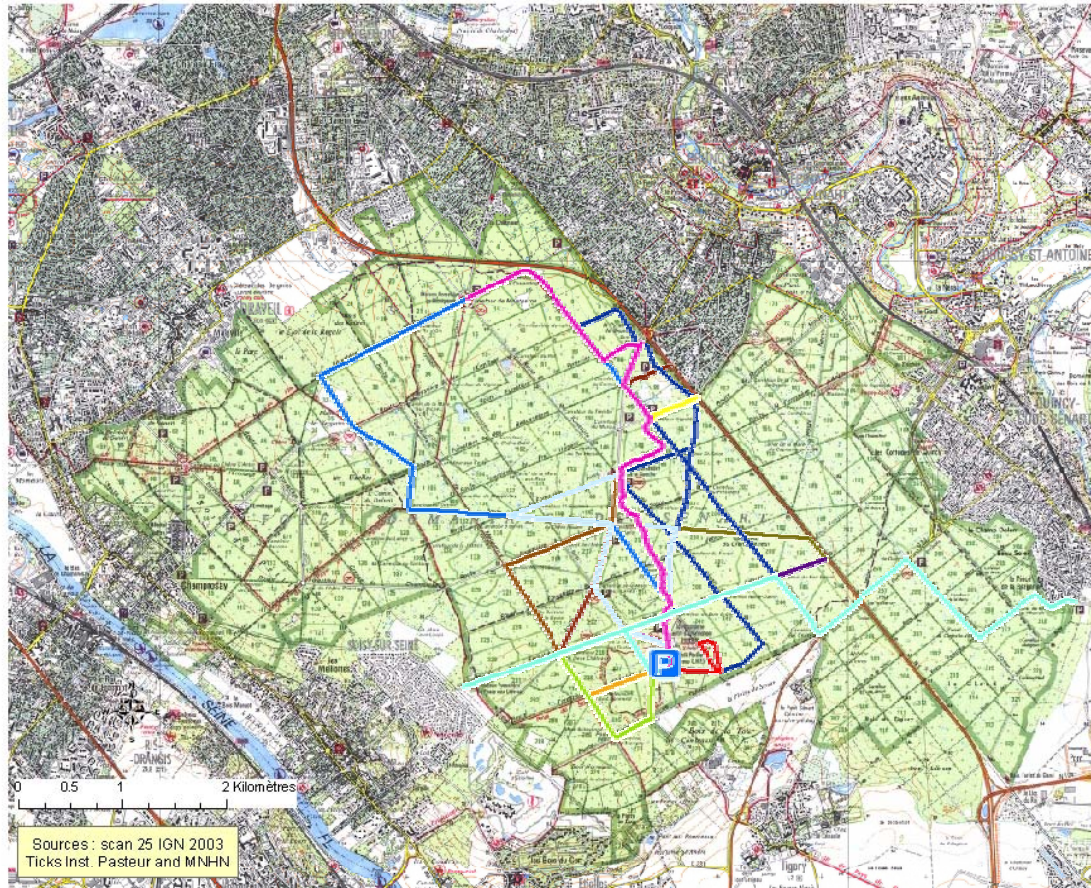

# The Lyme Disease in a Periurban Context

# 15 examples of paths in the Forest of Sénart

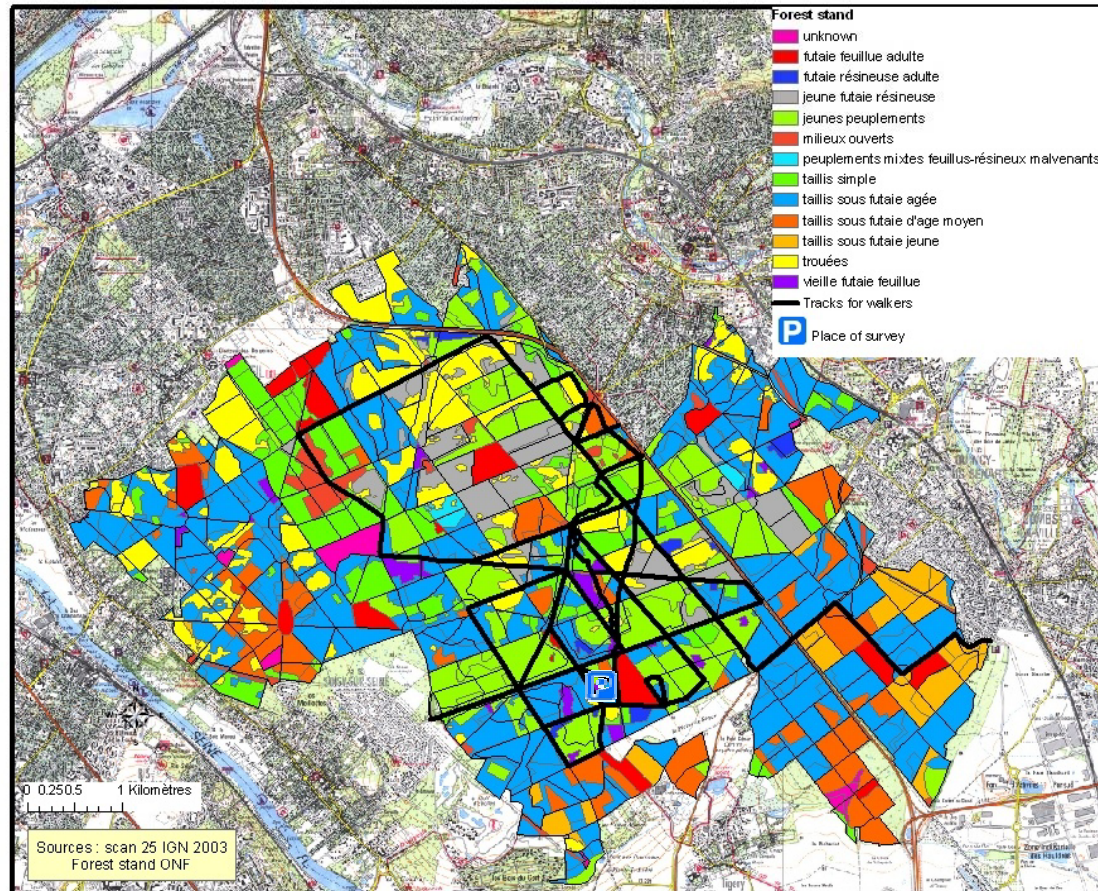

# Quantifying the number of trips per section

# What are the most popular forest stands?

# Are the ticky zones near most popular ways?

How to modelize the ticky zones?

## Modelling a health risk in La Courneuve park (northern Paris)

## Combining landscape elements associated with echinococcus egg conservation and use of the public park by susceptible individuals

## Modelling conservation of pathogenic eggs

- Risk mapping using multicriteria analysis

## Mapping the itinerary of susceptible individuals

- Itinerary map of linear trajectories from survey data
- Cartographic synthesis of trajectories of individuals at risk

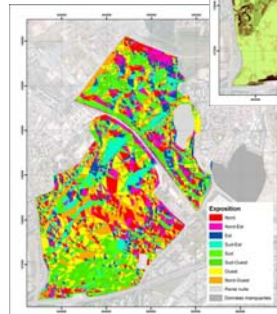

Landuse

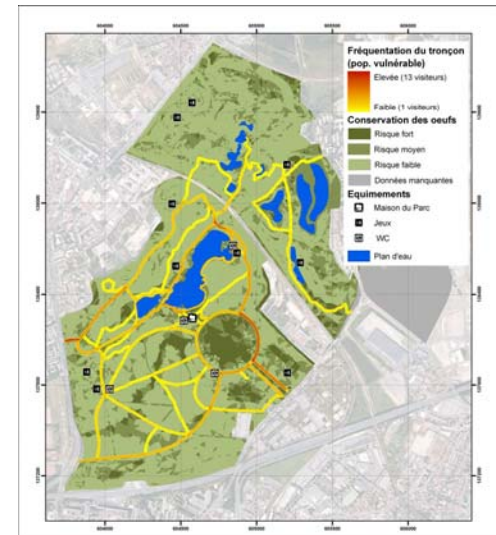

Slope

Aspect

## Risk exposure maps with a spatial itinerary analysis

 $\Rightarrow$ 

## Conclusion:

We would like to realise a large scale map of exposure at Lyme disease by modelling:

- Itinerary map of linear trajectories of individuals at risk (survey data)
- Relation between ticks and forest habitat

It would be interesting and necessary to enlarge this study at other peri-urban places.

We hope that this research into modelling will incite you to work with us!

Thank you.
